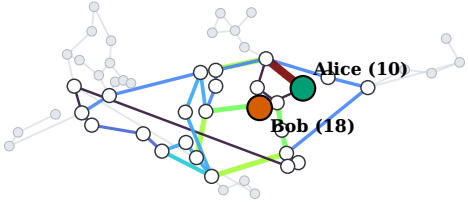
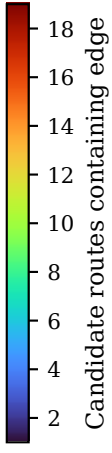
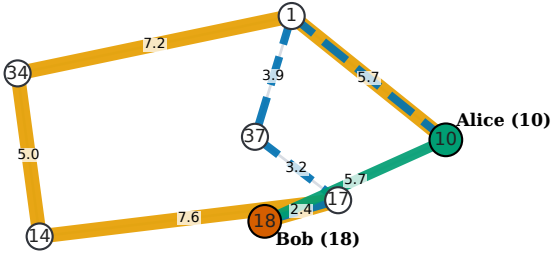
Why Iris is structurally difficult for independent route arms

(a) Iris topology and all 20 cycle-free routes
edge color = number of admitted routes





(b) The learned corridor versus audited equilibrium support



Tsallis empirical mode: r4, 5 hops, 27.8 km Audit detour: r18, 4 hops, 15.1 km Audit direct route: r19, 1 hops, 5.7 km

Coordinates provide layout only. The histogram backend uses the normalized fiber lengths stored on the edges.
